Problem Statement

Customer support experiences vary significantly across companies due to differences in response time, agent training, and issue complexity. It is difficult to quickly analyze these factors and predict a ticket's priority level. This project aims to develop a machine learning model that predicts ticket priority using key interaction indicators, helping support managers and agents make informed decisions to improve customer service.

I am	I'm trying to	But	Because	Which makes me feel
A support manager / customer care executive	analyze / predict ticket priority level	it takes a long time / is difficult	the data involves many interaction factors	Frustrated

Problem Statement (PS)	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	A Support Manager	Analyze a ticket's priority level	It takes a lot of time to analyze multiple interaction indicators manually	The data is complex and spread across different channels	Frustrated and delayed in making decisions
PS-2	A Customer Care Executive / Data Analyst	Predict the priority of a ticket accurately	Traditional methods are slow and less efficient	The relationship between sentiment, response time & severity is difficult to analyze manually	Challenged and less confident in the prediction
